Introduction

This document is a minimal example demonstrating Quarto's ability to render a single source file into **multiple output formats** simultaneously.

Run the following command in your terminal to render all formats at once:

```
quarto render multiple-output.qmd --to all
```

Quarto will produce four files:

- `multiple-output.html` — a styled web page
- `multiple-output.pdf` — a print-ready PDF (requires TinyTeX: `quarto install tinytex`)
- `multiple-output.epub` — an e-book
- `multiple-output.docx` — a Microsoft Word document

A Simple Example

Here is a short piece of content that will appear identically across all formats.

Mathematical Notation

Quarto supports LaTeX math in all formats:

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)$$

Code and Output

```
import math

values = [1, 4, 9, 16, 25]
roots  = [math.sqrt(v) for v in values]

for v, r in zip(values, roots):
    print(f"sqrt({v:2d}) = {r:.1f}")
```

A Table

Format	Extension	Needs extra tools?
HTML	.html	No
PDF	.pdf	TinyTeX / LaTeX
EPUB	.epub	No
Word	.docx	No

Summary

The key insight is that **you write your content once** and Quarto handles the conversion. Each format can be configured independently under its own key in the YAML header while sharing the same source document.
